

# Full Stack Engineer - Tech Test

## 2-hour Tech Test

One of our main products is our consent management plugin. We'd like you to bootstrap out the skeleton to a plugin.

- This plugin should:
  - Show a simple box over the website, that responds to resizing.
  - Block scrolling and click interactions on the website until the accept button is clicked.
  - Have a simple "Accept" button that unblocks the site, allows the user the scroll, and minimizes the plugin (Show plugin interaction with the base site).
  - Have a simple "Reject" button that takes the user to another view on the box, with some text in (Show navigation within the plugin). When the user clicks reject, make sure Google analytics scripts on the page are stopped.
- We'll give you a basic website with google analytics enabled.
- You can use whatever tech stack you would like. We want to see how you approach the foundations of a project.
- Please spend around 2 hours on this project. Give us a 'wow' moment, something special that you will bring to the team. This could be a awesome structure, webpack build/deploy, great test coverage etc. Surprise us!
